Business Problems

Two-fold:

- 1) Who should one follow in the Machine Learning (ML) & Web Development (WD) fields as a beginner/newbie in either community?
- 2) How often do the two communities collaborate? What can GitHub do to facilitate greater collaboration?

Data Overview

Description: A large social network of GitHub developers which was collected from the public API in June 2019.

Nodes: are developers who have starred at least 10 repositories

Edges: are mutual follower relationships between them.

Centrality scores for the top WD & ML members

		Degree	Betweenness	Closeness	Centrality
1	Web Developer	0.296	0.293	0.546	1.136
1	Machine Learning Engineer	0.065	0.116	0.331	0.512

Web Developers have higher centrality scores because there are more Web Developers in the dataset.

Networks for ML & WD

Web developer network

Machine Learning network

Network for WD + MLE: Nodes

Software Developer

Machine Learning Engineer

Software Developers engage in more diverse activities than Machine Learning Engineer

Network for WD + MLE: Edges

Within - Edge

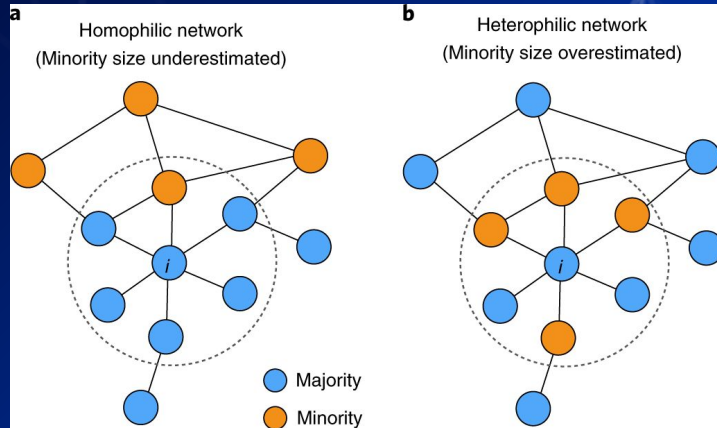

Cross - Edge

Circled part (roughly) indicates the ML community, more green within the community than WD's

Homophily Detection

**Expected probability
of a cross-edge**

0.383

**Actual probability
of a cross-edge**

0.155

Is one group more collaborative?

Proportion of cross-edges initiated by ML	0.485
Proportion of cross-edges initiated by WD	0.515

Rasbt - Statistics professor and machine learning researcher

// Conclusion & Insights

- **Bipartite network confirmed for the two groups of gitHub users - WD and ML**
- **There is strong evidence of homophily in both communities**
- **Neither community seems to follow the other more**
- **Popular members within their own community are not necessarily popular between both communities**

// Back to the Problem

- **1) Who do we recommend to beginners in a community?**
 - Consider deeper dive in community detection efforts
 - Current tag system is comprehensive & well-used
- **2) How do we encourage greater collaboration between communities?**
 - Tough for GitHub; both communities look inward typically
 - Super collaborative users are often entrepreneurs; academia is less collaborative

// Moving Forward

- **Create a suitable recommendation engine**
 - **Recommend similar topics of ML and WD to encourage collaboration**
 - **Recommend who to follow based on user data (topic modeling based on collaborative user bios is a possibility)**

A person is shown from the chest up, wearing a VR headset. The entire image is tinted with a deep blue color. Overlaid on the person's face and the headset is a white, intricate geometric pattern consisting of interconnected lines and dots, resembling a network or a molecular structure. The word "Questions?" is written in a large, white, sans-serif font in the upper left area.

Questions?

A green line-art illustration of a planet with a ring and three small circles on its surface, surrounded by several stars and a rocket ship. The background is a blue gradient with a white geometric network pattern.

- **Cross-Community Network and Homophily Detection**
- **Conclusion & Insights**

WBs are more social connected than MLs

Project Outline

We wanted to see how influential machine learning & web developers are with respect to their own communities & over the entire Github community

- We made two dataframes, one containing just machine learning (ML) & the other with web developers (WD)
- We calculated degree, betweenness, & closeness for both these dataframes
- Then we compared these metrics to the degree, betweenness & closeness for both dataframes combined to see how influential ML & WD are within their own communities and to the entire community (ML + WD)
